

# Final Team Project

Andrew Kim, Luis Perez, Renetta Nelson

October 17, 2022

## Problem Statement

The purpose of this project is to automate the wine selection process in order to increase profit and build on the business's reputation. This will be done by implementing a model that predicts the quality of the wine. The profit margin of restaurants is approximately 70%. This means that over half the profit of these business types come from wine. On the other hand, there are also major expenses that pertain to wine as well. From vendors to sommeliers, there are dozens of additional expenses when it comes to finding and purchasing good quality wine. The profits of the business can no longer support the expenses of the wine selection process. Within a few months, the expenses will exceed the profits of the business and the business will have to close down. The automation of the wine selection process will reduce the expenses by approximately 25%, allowing the business to build its finances and stay in business.

## Decision Trees

One of the aspects of decision trees that was relateable to our project goal was its ability to effectively choose between various actions. For this project, supervised learning would be the best way to go. The objective is to predict which wines are low quality (0) and high quality (1). Part of the process in determining the output is understanding how the output was chosen. By using decision tree, we can examine the choices made in the process and what role the predictors played. After fitting the data, predictions were made with the testing data. A confusion matrix was plotted along with a classification report showing how well the model did. The accuracy score for this model is 74 and the cross validation score is approx 73 percent. Recall gives a general overview saying of the total amount of actual good quality values, which were correctly predicted as good quality. Precision says of the total amount of predicted good quality values, how many actually have a true value of 6 or higher. F1 score focuses on recall and precision simultaneously. F1 score compare the performance of the two metrics.

In [206...]

```
decisiontree = DecisionTreeClassifier().fit(train_x, train_y)
```

```

y_pred = decisiontree.predict(test_x)

plot_confusion_matrix(decisiontree, test_x, test_y)
plt.grid(False)

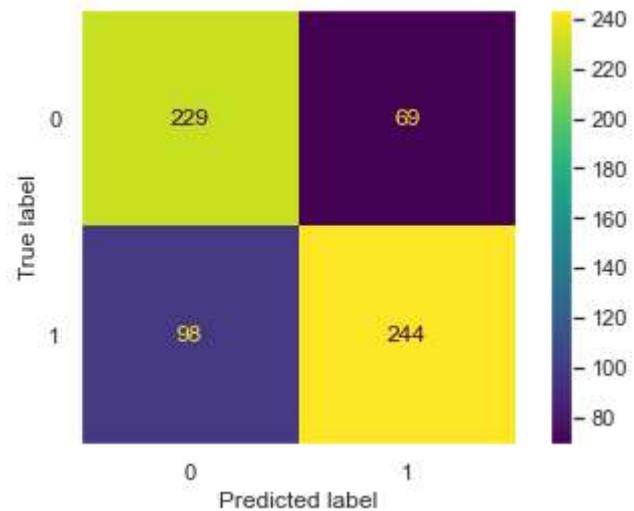

print(classification_report(test_y, y_pred))

print("Cross Val Score: ", stats.mean(cross_val_score(decisiontree, train_x, train_y, cv = 5)))

```

	precision	recall	f1-score	support
0	0.70	0.77	0.73	298
1	0.78	0.71	0.75	342
accuracy			0.74	640
macro avg	0.74	0.74	0.74	640
weighted avg	0.74	0.74	0.74	640

Cross Val Score: 0.7236311082024433

## Neural Network

When looking into which wines have good and poor quality, the balance of the components play a huge role. It is not solely about if this one had too high of a pH or if another one is a low level of sweetness which makes it bitter. It is about the uniformity of each ingredient and how they complement each other. This is one of the reasons why wine tastes better with age. It gives the components time to mix and

balance each other out. When creating a model to predict which wine has good or bad quality, part of the process is to figure out the relationship between the predictors (the components of the wine). Neural networks can help to do just that.

In [207]:

```
neuralnet = MLPClassifier(hidden_layer_sizes = (3), activation = 'logistic', solver = 'lbfgs', random_state =1).fit(train_x)

nnet_pred = neuralnet.predict(test_x)

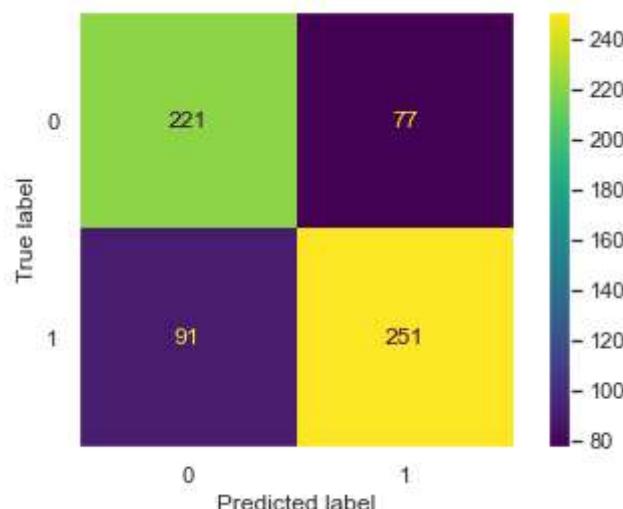

plot_confusion_matrix(neuralnet, test_x, test_y)
plt.grid(False)

print(classification_report(test_y, nnet_pred))

print("Cross Val Score: ", stats.mean(cross_val_score(neuralnet, train_x, train_y, cv = 5)))
```

	precision	recall	f1-score	support
0	0.71	0.74	0.72	298
1	0.77	0.73	0.75	342
accuracy			0.74	640
macro avg	0.74	0.74	0.74	640
weighted avg	0.74	0.74	0.74	640

Cross Val Score: 0.7184173211169285

## Support Vector Machines (SVM)

In [203...]

```
from sklearn import svm

supportvec = svm.SVC().fit(train_x, train_y)

svm_pred = supportvec.predict(test_x)

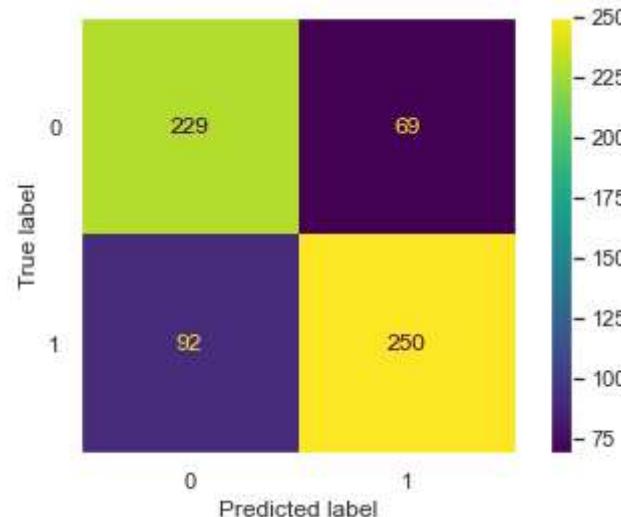

plot_confusion_matrix(supportvec, test_x, test_y)
plt.grid(False)

print(classification_report(test_y, svm_pred))

print("Cross Val Score: ", stats.mean(cross_val_score(supportvec, train_x, train_y, cv = 5)))
```

	precision	recall	f1-score	support
0	0.71	0.77	0.74	298
1	0.78	0.73	0.76	342
